

Thursday May 31, 2007  
US Department of Interior  
Attention: Mark Negri

We continue share the belief that Google's technology can help the Department of the Interior more effectively accomplish its mission and improve the communication, consultation and cooperation of organizations involved in managing our National resources. Google remains genuinely committed to defining and supporting a productive partnership with the Department of Interior and confident that together we can deliver a tremendously positive impact to very important objectives.

The Department has expressed renewed and immediate interest to ensure the Google Earth consumer clients which Department employees have been using in professional capacity are not in violation of the Google license. We fully support the continued and expanding interest in, and use of Google Earth by the Department of Interior while we continue active pursuit to define a logical and appropriate Enterprise wide licensing agreement for Google Earth Enterprise solutions prior to September 30, 2007.

Prior to this, Department of Interior and any of its bureaus should not be compelled for reasons related to the Google Earth consumer license to remove or restrict the download and use of the Google Earth client. Additionally, the Department should not hesitate for any reason to publish data in for others to consume with a Google Earth client. Most exciting are the examples and use cases which are being documented through the ongoing effort to understand how DOI employees are currently using Google's technology to exploit existing investments, improve access to and understanding of information and more efficiently and effectively supporting the mission goals.

All of our Geospatial products continue to be available today through commercial license options and offered on a GSA schedule which affords any bureau the ability for controlled leverage of Google Earth technology within their own environment, with no compliance concerns.

We agree that the proven adoption and use of the Google Earth consumer client across a very broad community of users validates that the Google Earth client interface solves a long standing challenge of how to effectively train users how to access, leverage and benefit from geospatial data. Our experience assisting many Federal Government agencies with making data efficiently available to broad user communities strengthens our confidence that Google's technology can play a highly visible role supporting more strategic management decisions, better accessibility to public citizens and more transparency and awareness for employees supporting both.

Google Earth expands the awareness of, and increases the value the Department of the Interior can recognize and achieve from, the incredible investment of time, energy and capital already made in IT systems, including ever-growing GIS requirements. We welcome the opportunity to extend a mutual understanding for how the Department and Google can work together to improve the Department's mission outcome. Thank you for your sharing your licensing concerns and willingness to work with Google to discuss your enterprise. We very much look forward to working closely with DOI and welcome the chance to help expand the reach of your important research and education mission.
